Total Records	Average Weekly Sales	Stores
6,435	\$1,046,964.88	45

Hello! I have analysed the Dataset.It contains 6,435 records across 45 stores. Ask me anything — store performance, holiday impact, economic factors, sales trends, or anything else!

Top 5 stores

- The top 5 stores by average weekly sales are:
- Store 20: \$2,107,676.87
 - Store 4: \$2,094,712.96
 - Store 14: \$2,020,978.40
 - Store 13: \$2,003,620.31
 - Store 2: \$1,925,751.34

bottom 5 stores

- The bottom 5 stores by average weekly sales are:
- Store 33: \$259,861.69
 - Store 44: \$302,748.87
 - Store 5: \$318,011.81
 - Store 36: \$373,511.99
 - Store 38: \$385,731.65

How did holiday weeks impact sales compared to non-holiday weeks?

Based on the provided data summary, I can tell you that approximately 7% of the weeks in the dataset are holiday weeks (indicated by the `Holiday_Flag` mean of 0.07).

However, the summary does not provide separate average weekly sales figures specifically for holiday weeks versus non-holiday weeks. Therefore, I cannot quantify the direct impact of

holiday weeks on sales from this information alone. The overall average weekly sales across all weeks (holiday and non-holiday combined) is \$1,046,964.88.

Give me 3 actionable recommendations for Walmart store management based on this data.

Here are 3 actionable recommendations for Walmart store management based on the provided data:

- 1. Identify and Replicate Best Practices from High-Performing Stores:** Leverage the operational successes of top stores like Store 20 (averaging 2,107,676.87 * **inweeklysales*) and Store 4 (averaging * 2,094,712.96). Investigate their strategies in merchandising, inventory management, staffing, or local marketing, and develop a program to transfer these best practices to other locations, particularly those underperforming.
- 2. Conduct Targeted Interventions for Underperforming Stores:** Prioritize in-depth analysis for the bottom 5 stores, such as Store 33 (averaging 259,861.69 * **inweeklysales*) and Store 44 (averaging * 302,748.87). Identify specific local challenges (e.g., competition, market demographics, operational inefficiencies) unique to these locations and implement tailored improvement plans to boost their sales closer to the overall average of \$1,046,964.88.
- 3. Enhance Sales Forecasting and Anomaly Detection with Contextual Data:** Given the high variability in `Weekly_Sales` (standard deviation of 564,366.62 * **andarange from * 209,986.25 to \$3,818,686.45*), integrate external factors like `Temperature`, `Fuel_Price`, `CPI`, and `Unemployment` into predictive models. This will allow managers to better anticipate sales fluctuations and understand potential drivers behind unusually high or low weekly sales, enabling more proactive inventory, staffing, and promotional adjustments.
